public health response, which included

Measles outbreak traced to Disneyland is declared over

Los Angeles: California health authorities on Friday declared an end to a large measles outbreak that started at Disneyland and triggered a national debate about vaccinations. Disease detectives for months hunted to contain the highly contagious disease, which surfaced at Disney theme parks in December in the form of an Israeli woman who had visited the parks days before she became ill.

After 42 days — or two incubation periods — meaning the outbreak is over in the U.S., California health authorities said in a statement. "Having this measles outbreak behind us is a significant accomplishment," said Dr. Gil Chavez, state epidemiologist. "It's been just amazing, " Cristoforetti said after trying the world’s first espresso in space.

Espresso maker designed for astronauts arrives at SpaceX

Cape Canaveral: The SpaceX supply ship arrived at the International Space Station on Friday, delivering the world’s first espresso machine designed exclusively for astronauts. Italian astronaut Samantha Cristoforetti captained the Dragon capsule, which arrived three days after it landed in the Pacific, with the help of a giant robot arm. The cargo carrier holds more than 4,000 pounds of much-needed groceries, experiments and equipment. Italy provided the espresso machine for Cristoforetti, which has been stuck with instant coffee since her mission began in December.

"It’s been just amazing," Cristoforetti said after trying the Dragon over the Pacific. "Lots of science and even coffee in there, so that’s pretty exciting." Within 2 1/2 hours of its capture, the Dragon was bolted securely to the space station. The espresso machine is three months late because of the backlog created by last year’s loss of the cargo ship. In this image from NASA-TV shows the SpaceX Dragon-6 resupply capsule Friday April 17, 2015 as it holds at the grapple point, docked to the International Space Station.

Outbreak of 2014 was contained

While the Disneyland outbreak is over in the U.S., it’s still a problem in the Canadian province of Quebec, where 159 people were sickened after someone visited the theme park and returned home. Most belong to a tight-knit religious community with a low vaccination rate.

Measles has been eliminated in the U.S. for more than a decade, but outbreaks still occur when travelers become infected overseas and visit the theme park, said Vigno, who said the nearly 2,600 cases this year are the lowest since 1978.

"It’s been just amazing," Cristoforetti said after trying the world’s first espresso in space.
