Vietnam rice boom heaping pressure on farmers, environment

By Peter Wadhams

AUSTIN: Dr William Cooke, far left, speaks during a meeting with local and state officials about the recent HIV outbreak in Scott County at the Austin Courthouse in Austin, Texas, Missouri, on Wednesday, March 25, 2015. — AP

In the United States, the Indiana situation appears to represent one of the most difficult adaptation, planning and management challenges the country is likely to face in the near future. The system of dykes, which blocks floodwaters, is preventing millions from flowing freely and over time "will force the evacuation of millions of people," said Bong Joon Ho, the general director of the national 문화재청.

INDEXES

Three indexers listed in the index page are made up of the Dow Jones industrial average, the Dow Jones transportation average, and the Dow Jones railroad average. The Dow Jones industrial average is computed by adding the closing prices of 30 common stocks and then dividing by 30. The Dow Jones transportation average is computed by adding the closing prices of 20 transportation stocks and then dividing by 20. The Dow Jones railroad average is computed by adding the closing prices of 10 railroad stocks and then dividing by 10.

Mechanical indexers are used to determine the closing prices of stocks. However, the Dow Jones average is not a true average of the price movements of the stocks that make it up. The Dow Jones industrial average is a weighted average of the closing prices of the stocks that make it up. The weights are based on the market value of each stock, which is determined by multiplying the number of shares outstanding by the price per share. The weights are adjusted each year to reflect changes in the market value of each stock.

The Dow Jones transportation and railroad averages are computed in the same way as the Dow Jones industrial average, except that the weights are based on the market value of each stock and the number of shares outstanding is not considered.
