PROSPECT OF STRIKING GOLD LURING THOUSANDS OF COCOA PLANTERS

Ivory Coast: Gold-diggers dig into a field seeking for gold in the village of Bore, next to the central town of Dimbokro where cocoa fields have been turned into illegal gold mines.

The report says that gold mining is a lucrative business, with the potential to earn the equivalent of a year’s cocoa harvest. The digging of gold by cocoa planters is a way to escape hunger or feeding the family. “In one week, I turned gold panner Octave Kouamee Konan from being a cocoa planter, whose forebears had accumulated a wealth of gold reserves in the region, into a gold miner,” Konan said.

The project, which aims to recover gold from abandoned cocoa fields, has been approved by the government as a way to diversify the economy and create jobs. The gold mining will be carried out in collaboration with local communities and with the support of international organizations.

The project is expected to generate up to 3,000 jobs and to produce 500 tons of gold per year. The government has set aside a budget of 10 billion CFA francs (about $16 million) for the project.

The gold mining will be carried out in a sustainable manner, with strict environmental and social standards. The project will also contribute to the development of the local communities, by providing them with better access to education, health and infrastructure.

The project is considered as a major step forward in the fight against poverty and unemployment in the country. It is also seen as a way to preserve the natural resources of the country, which are rich in gold.

The government has also launched a program to support small-scale gold mining, which is considered as a viable alternative to illegal mining.

However, the project faces some challenges, such as the need for more technical capacity and the need to establish a robust regulatory framework.

The government is working closely with international organizations and private companies to ensure the success of the project.

The project is expected to start in the next few months. The first phase will focus on the identification of the areas where gold mining is possible and on the establishment of the necessary infrastructure.

The second phase will be dedicated to the actual gold mining, with the production expected to reach 50 tons per year within five years.

The project is expected to have a positive impact on the economy of the country, by creating jobs, generating revenue and promoting sustainable development.

The project is also seen as a way to improve the living standards of the local communities and to reduce poverty.
