Total solar eclipse entralls US

The shadow cast by the moon as it completely obscured the sun, known as an eclipse, was a rare and breathtaking sight for those who were able to witness it. The path of totality was a narrow strip that crossed through Oregon, Idaho, and Wyoming, with observers in these regions experiencing the longest duration of totality. The eclipse began at 1:16 pm EDT in Oregon, at 1:45 pm MDT in Colorado, and at 2:47 pm EDT in South Carolina. This was the first total solar eclipse in the United States since 1997, and the first in the country since 2017. The total solar eclipse lasted for about two minutes and 41 seconds, during which the moon completely covered the sun, creating a phenomenon known as the “diamond ring effect.” 

Astronomers were giddy with excitement. A solar eclipse is considered one of the greatest wonders of nature, and the astrophotographers who were setting up their cameras along the path of totality were eager to capture the event. People from all over the world came to see the eclipse, and the path of totality was lined with people who had set up their cameras and prepared for the spectacle. The eclipse was not just a natural wonder, but also a significant moment in history, as it was the first total solar eclipse in the United States since 1997.

The scene was one of wonder and excitement as people lined up to see the eclipse.
