Cyclopedia: Muslim states' stances on anti-Semitism

By Joe Named and Laura Newgard

There must be an answer. Whatever it is, harnessing US diplomacy in Havana, it hasiated the doctors, scientists and intel- lligence analysts searching for answers. Before the conference no one knew, investigators have many theories, including a sonic attack, electronic weapons or possibly electromagnetic waves. The US president seems to be part of at least one of these theories. Whether a rogue faction of the security, a foreign power or whether the combination is blame, more than a dozen US officials with the investigation say it's not inconceivable that they were targeted by some entity. The theories have been driven by the CNN, BBC, The Washington Post and others. Theories about the US military have been floated, that the FBI, CIA and other intelligence agencies are getting involved. The theories are being pursued by the US military, the FBI, CIA, CIA and other intelligence agencies.

Perhaps the biggest mystery is why the symptoms, sounds and sensations are often dramatically different from person to person. Of the 20 medically confirmed US cases, some have permanent hearing loss, while others have been left with symptoms that range from hearing loss to loss of sight or balance.

"They are very nonspecific symptoms," one doctor told the New York Times, "they are not like a diagnostic tool."

By Joe Named and Laura Newgard

There are currently no therapies for the symptoms. Theories have been put forward by scientists, physiologists, acoustic engineers and researchers, and others about the theory being pursued.

Some scientists believe that the symptoms are caused by infrasound, a low-frequency sound that can travel through walls, water and other materials. Scientists believe that infrasound can cause lasting damage once the sound waves reach body tissues.

Some doctors believe that the symptoms are caused by a near-infrared sound wave, but there's little evidence to support that hypothesis. Scientists believe that infrasound can cause lasting damage once the sound waves reach body tissues.
